

Olas Operations Manager

Master documentation, architecture, business rules, execution plan and Antigravity instructions

Purpose	Upgrade the existing hotelrunner-daily project into a reliable operations manager without rebuilding working functionality.
Properties	Olas, Tide and Sunrise - Imsouane operations.
Core principle	Facts are calculated deterministically. Rules detect operational risk. AI explains, prioritizes and answers questions. AI never invents operational data.
Current priority	Meal totals, dinner preparation, tomorrow transfers, Telegram reliability/readability, conflicts and system health.

Instruction to Antigravity: Treat this document as the product specification. Inspect the current repository before changing code. Preserve working behavior. Implement in phases, add regression tests first, and do not redesign modules merely for style.

1. Existing system - preserve the baseline

The current public repository already contains a useful modular base: HotelRunner reporting, reservation cache/audit files, a data model, conflict engine, extras engine, Google Sheets support, surf scheduling, manager reporting, alert state, Telegram sending, tests and an HTML dashboard. The normal report is documented as covering today plus the next 7 days and includes check-ins, check-outs, in-house totals, meal plans, notes, messages, bed requests and duplicate/multi-bed situations.

- **Do not start a new application.** Extend the existing code.
- Keep the current team report unchanged unless a requirement below explicitly changes it.
- Keep the detailed dashboard for inspection; make Telegram action-oriented.
- Create a baseline tag/branch and make current tests pass before refactoring.
- Any refactor must be justified by one shared operational data model or reliability need.

2. Target architecture

All features must consume one normalized operational truth. Avoid separate parsers for dinner, Telegram, transfers and dashboard.

Layer	Responsibility
Sources	HotelRunner reservations + guest details + notes + Additional Fees/Extras; Sunrise/Google Sheet; surf schedule; manual blocks/config.
Normalization	Reservation, guest-night, room/bed, meal entitlement, extra, transfer and operational-note records.
Rules	Meal counts, dinner setup, transfer readiness, room/bed conflicts, surf/meal conflicts, missing information.
Manager state	Today, tomorrow, unresolved attention items, preparation tasks and delivery status.
Outputs	Dashboard, scheduled Telegram, change alerts, future conversational Telegram.
AI layer	Intent understanding, summarization, prioritization and explanation only. It must call deterministic data/rules for facts.

3. Property and room model

Sunrise mapping - fixed business rule

Sunrise has four private rooms plus one physical 5-bed dorm. HotelRunner bed identifiers for the dorm must not be treated as separate rooms.

ID	House	Type	Physical room / bed logic
9200	Sunrise	Private	One private room
9300-1 ... 9300-5	Sunrise	Dorm	One physical room 9300; five individual beds
9400	Sunrise	Private	One private room
9500	Sunrise	Private	One private room
9600	Sunrise	Private	One private room

- Different 9300-x beds may be occupied simultaneously.
- Two overlapping reservations on the same 9300-x bed are a bed conflict.
- Dashboard should summarize occupancy as, for example, **Sunrise - 9300 Dorm - 4/5 beds occupied**.

4. Meal entitlement and today's dinner total

This is the first data-quality feature to finish. The system must always be able to answer **How many people have dinner today?** and explain exactly why each guest was counted.

Sources to inspect for each active guest

- **Meal plan:** Full Board, All Inclusive and Half Board count for dinner.
- **Notes:** manually written dinner/meal arrangements must be parsed into a normalized entitlement when clear.
- **Additional Fees / guest details:** paid dinner or meal extras must be included.
- **Sunrise / Google Sheet:** normalize into the same entitlement model.
- **Deduplication:** a person with Half Board plus a dinner-related extra is still one dinner guest unless the extra explicitly represents additional people.
- **Ambiguity:** unknown wording goes to Needs confirmation; never guess.

Required output

Dinner today: 21

Olas: 14 | Tide: 5 | Sunrise: 2

Behind this total, provide an audit list: guest name, house, source and reason (Half Board / Full Board / All Inclusive / Additional Fee / Note).

Dinner setup rule

- **0-13 dinner guests:** normal setup.
- **14-24 dinner guests:** extra tables required.
- **More than 24:** capacity warning requiring manager attention.

Do not calculate the number of extra tables until seats-per-extra-table is explicitly configured. The current guaranteed rule is only that more than 13 requires extra tables, while total capacity with extra tables is 24.

5. Transfer business rules

Transfers are a day-before preparation task. The manager must not wait until the transfer day.

How a transfer is detected

- **All Inclusive:** transfer is included.

- **Notes:** if a transfer request is written in the reservation note, treat it as a transfer.
- **Additional Fees / guest details:** explicit transfer extras count.
- Do not infer a transfer solely because a guest is arriving or departing.

Transfer record

- Direction: Arrival or Departure.
- House: Olas, Tide or Sunrise.
- Date and passenger count.
- Arrival: flight number and airport/location when available.
- Departure: pickup time and destination when available.
- Raw source/reason: All Inclusive, note or Additional Fee.
- Status: Needs info -> Ready to send -> Sent.

Taxi workflow

Olas normally uses one taxi driver. The system therefore does not need a driver-assignment marketplace. Its job is to prepare the information, generate the message in the established format, remind one day before, and track whether Ismail has sent it.

Arrival message format

Arrivée *Olas*
 20 septembre 2026
 Guest Name X1
 Flight number: HV6491
 Agadir airport

Departure message format

Depart *Tide*
 18 septembre 2026
 Guest Name X2
 Time: 15:30
 Agadir airport

Scheduled tomorrow-transfer check

- Run every evening at a configurable Morocco-local time.
- Always send a result, including **No transfers tomorrow**, so the user knows the check ran.
- All Inclusive + arrival/departure tomorrow + missing transfer details is itself a Needs Attention item.
- If information is complete but status is not Sent, keep it visible as Ready to send.
- Provide a **Copy driver message** action in the dashboard before attempting any automated WhatsApp sending.

6. Telegram design

Telegram has two different jobs and they must remain separate.

A. Today/Tomorrow Change Watch

- Only reservations affecting today or tomorrow.
- Silent when nothing operationally relevant changed.
- Changes to extras/notes/transfer information must be included in the comparison if they affect operations.

B. Scheduled preparation

- Tomorrow Transfers runs independently from reservation-change detection.
- Later, Tomorrow Preparation can include dinner setup, room turnovers, surf/meal issues and unresolved risks.

Formatting

Use simple headings, whitespace and one divider. Avoid decorative emoji overload. Red/orange markers are reserved for actual attention.

TOMORROW - TRANSFERS

READY TO SEND

Arrival - OIas
Guest Name X2
Flight: AT425
Agadir Airport

NEEDS INFORMATION

Departure - Tide
Pickup time missing

7. Telegram reliability - mandatory

- The pipeline must use fresh data before evaluating changes.
- Correct order: fetch -> normalize -> build relevant state -> compare -> send Telegram -> only after successful send persist/acknowledge the new notification state.
- If Telegram fails, do not advance the notification snapshot. Keep the alert pending for retry.
- Log each run with timestamp, fetch success, records processed, alert count, Telegram result and error.
- Add health information to dashboard: last HotelRunner fetch, last Sunrise/Sheet fetch, last checker run, last successful Telegram send and current error state.
- Do not interpret Telegram silence as success; scheduled preparation messages should make important daily jobs observable.

8. Conflict and prevention engine

Rooms and beds

- Detect overlapping private-room reservations.
- Detect overlapping assignments to the same dorm bed.
- Do not flag different beds in the same dorm as conflicts.
- Same-day checkout/check-in is not an overnight overlap.
- Check alternatives across OIas, Tide and Sunrise before escalating.
- Never automatically cancel a reservation or invent a cancellation reason.

Surf and meals

- Morning surf is operationally preferred when conditions and coach decisions allow.
- Local planning preference: Bay - low-to-mid or mid-to-low; Cathedral - high-to-mid or mid-to-high.
- Coach/manager remains final authority; tide/weather data is support information only.
- Compare confirmed surf session + duration + return buffer with breakfast/lunch/dinner.
- If a conflict exists, tell kitchen ahead of time and identify affected guests.

Extras

- Normalize known extras: transfer, breakfast/lunch/dinner, surf lesson, equipment, extra bed and other operational services.
- Unknown paid extras become Needs confirmation with the original description; do not silently discard them.

9. Dashboard specification

Section	Must show
Today	In-house, arrivals, departures, breakfast/lunch/dinner totals, surf, transfers and attention items.
Tomorrow Prep	Transfers first; then dinner setup, arrivals/departures, room turnovers and future preparation rules.
Meals	Totals by house and combined total; click-through/audit list showing why each guest is counted.
Transfers	Needs info / Ready to send / Sent; generated driver text and Copy action.
Rooms	Physical rooms and dorm-bed occupancy; Sunrise 9300 shown as one 5-bed dorm.
Risks	Room/bed conflicts, capacity issues, missing transfer data, unknown extras, surf/meal conflicts.
System Health	Last source fetches, checker run, Telegram success/failure and stale-data warning.

10. Future conversational Telegram agent

After the deterministic engines are trusted, the bot may accept natural-language questions. The AI interprets intent; the application supplies the answer.

Examples:

- Check today and tell me if there is a transfer I need to check.
 - How many people have dinner tonight?
 - Who arrives tomorrow?
 - What extras did this guest book?
 - Are there any room conflicts this week?
 - What do I need to prepare for tomorrow?
 - Is there anything I am forgetting?
- Read-only questions may answer immediately.
 - Any future write action that changes a reservation, room, block or status should require explicit confirmation.
 - The AI must cite/identify the underlying operational records in the UI where useful; it must not answer from memory.

11. Execution plan for Antigravity

Phase 0 - Protect the working version

Create a branch/tag. Run all existing tests. Capture current dashboard/team-report/Telegram outputs as regression fixtures. No feature changes.

Phase 1 - One normalized data contract

Inspect data_model.py, extras_engine.py, google_sheets.py and current HotelRunner parsing. Define stable records for Reservation, GuestNight, RoomAssignment, MealEntitlement, Extra, Transfer and AttentionItem. Reuse existing structures where possible.

Phase 2 - Meal engine

Implement auditable breakfast/lunch/dinner entitlements from meal plan, notes, Additional Fees and Sunrise data. Add deduplication and date semantics. Expose today's dinner total and guest-level reasons.

Phase 3 - Dinner preparation rule

Apply 0-13 normal, 14-24 extra tables, >24 capacity warning. Do not invent number of extra tables.

Phase 4 - Transfer engine

Detect All Inclusive/note/Additional Fee transfers, normalize arrival/departure information, generate taxi-driver text and statuses.

Phase 5 - Tomorrow Transfer job

Create independent daily preparation job. Always send a result. Add missing-info warnings and Sent state.

Phase 6 - Telegram reliability

Make delivery acknowledgement atomic: only persist notification state after successful send. Add retry behavior and run logs.

Phase 7 - Telegram readability

Create compact templates for change alerts and preparation messages. Keep existing team report separate.

Phase 8 - Dashboard upgrade

Add Today, Tomorrow Prep, Meals, Transfers, Rooms/Risks and System Health views using the same normalized engines.

Phase 9 - Conflict/risk hardening

Verify Sunrise dorm logic, room/bed overlaps, alternatives, extras and surf/meal warnings.

Phase 10 - Conversational bot

Only now add natural-language read-only questions. Map intents to deterministic query functions. Add write confirmation later if needed.

12. Engineering rules - avoid coding twice

- **Single source of truth:** dashboard, Telegram and AI must call the same domain functions.
- **Pure functions where possible:** meal calculation, conflict detection and transfer readiness should be testable without network access.
- **Adapters at the edges:** HotelRunner and Google Sheets parsing should be separated from business rules.
- **Configuration over scattered constants:** dinner thresholds, timezone, scheduled time and room mappings belong in one config/domain configuration.
- **Idempotency:** rerunning a scheduled job must not duplicate notifications or corrupt state.
- **Observability:** every automation needs last-run/last-success/error information.
- **No silent parsing:** unknown meal/extra/transfer text is surfaced for review.
- **Backward compatibility:** preserve current reports unless a phase explicitly replaces an output.
- **Small pull requests/commits:** complete and test one phase before starting the next.

13. Required test matrix

- Half Board guest active tonight -> exactly one dinner.
- Full Board guest active tonight -> exactly one dinner.
- All Inclusive guest active tonight -> dinner plus transfer entitlement.
- Room-only/B&B; guest with paid dinner Additional Fee -> dinner counted.
- Guest with meal plan plus duplicate dinner wording -> not double-counted.
- Ambiguous note/extra -> Needs confirmation, not guessed.
- Sunrise Google Sheet guest -> same meal logic as HotelRunner.
- Dinner total 13 -> normal setup; 14 -> extra tables; 24 -> extra tables but capacity OK; 25 -> capacity warning.
- All Inclusive arrival tomorrow with complete flight details -> Ready to send.
- All Inclusive arrival tomorrow missing flight/arrival details -> Needs info.
- Departure tomorrow missing pickup time -> Needs info.

- No transfers tomorrow -> scheduled confirmation message still sent.
- Telegram send failure -> notification state remains pending and retries.
- Same 9300-1 overlapping -> conflict; 9300-1 and 9300-2 overlapping -> no bed conflict.
- 9300 dorm occupancy never exceeds 5 without warning.
- Same-day checkout/check-in -> no overnight overlap.
- Existing team report output remains unchanged unless explicitly approved.

14. Definition of done

- Dashboard can answer today's dinner total with a guest-by-guest audit trail.
- Dinner preparation warning appears automatically above 13 guests and capacity warning above 24.
- Tomorrow transfers are surfaced every day independently of reservation changes.
- Taxi message is generated in the established Arrival/Departure format.
- Transfer status clearly shows Needs info, Ready to send or Sent.
- Telegram failures cannot permanently consume an alert.
- Sunrise room 9300 is represented as one 5-bed dorm with individual bed conflict checks.
- Dashboard exposes stale-data/system-health status.
- No existing working behavior is lost; automated tests cover the new rules.
- Only after these are stable should the conversational AI manager be enabled.

15. Open configuration decisions - do not guess

- Exact Morocco-local time for the daily tomorrow-transfer message.
- Exact seats per extra dining table, if later needed to calculate the number of tables.
- Detailed breakfast/lunch semantics for every package if not already encoded.
- Any transfer wording/Additional Fee labels that the current parser does not recognize.
- Whether the Sent transfer status is stored manually in app state or inferred from a future messaging integration.

Antigravity should implement safe defaults only where the existing repository already has an established behavior. For the items above, expose configuration or leave a clearly marked TODO rather than inventing business rules.

16. Antigravity master instruction

Read the repository first. Do not rewrite working modules. Start with tests and a baseline. Build one normalized operational model, then make meals, transfers, Telegram and dashboard consume it. Complete phases sequentially. After each phase: run tests, inspect outputs, document changed files, explain migration/state implications, and stop if a business rule is ambiguous. Never invent guest data, meal entitlement, transfer details, room availability or operational status. Keep the existing team report separate from manager alerts. Optimize for reliability, auditability and simple mobile use.

Public repository baseline reviewed on 23 September 2026: som3adr/hotelrunner-daily. The repository documents a read-only HotelRunner report and contains the existing modules referenced in this plan.
